Recommended Guidance for Behavioral Health

Background

SARS-CoV-2 is a novel coronavirus that has emerged and caused coronavirus disease (abbreviated as COVID-19). Public health experts continue to learn about SARS-CoV-2, but based on current data and similar coronaviruses, spread from person-to-person happens most frequently among close contacts (those within about six feet) via respiratory droplets. Transmission of SARS-CoV-2 to persons from surfaces contaminated with the virus has not been documented yet, but current evidence suggests that SARS-CoV-2 may remain viable for hours to days on surfaces made from a variety of material. One primary measure discussed in this guidance will be self-care and knowing when to reach out for support.

Purpose

The outbreak of coronavirus disease 2019 (COVID-19) may be stressful for people. Fear and anxiety about a disease can be overwhelming and cause strong emotions in adults and children. Coping with stress will make you, the people you care about, and your community stronger.

Everyone reacts differently to stressful situations. How you respond to the outbreak can depend on your background, the things that make you different from other people, and the community you live in.

Definitions

COVID-19 is caused by a new virus. There is much to learn about the transmissibility, severity, and other features of the disease. Everyone can do their part to help plan, prepare, and respond to this emerging public health threat.

Recommended Actions

When you hear, read, or watch news about an outbreak of an infectious disease, you may feel anxious and show signs of stress. These signs of stress are normal, and may be more likely or pronounced in people with loved ones in parts of the world affected by the outbreak. In the wake of an infectious disease outbreak, monitor your own physical and mental health. Know the signs of stress in yourself and your loved ones. Know how to relieve stress, and know when to get help.
Common signs of anxiety and stress

- Fear and worry about your own health and the health of your loved ones
- Changes in sleep or eating patterns
- Difficulty sleeping or concentrating
- Worsening of chronic health problems
- Increased use of alcohol, tobacco, or other drugs
- Having stomachaches or diarrhea
- Having headaches and other pains
- Losing your appetite or eating too much
- Having trouble remembering things
- Feeling confused
- Having trouble thinking clearly and concentrating
- Having difficulty making decisions

People with preexisting mental health conditions should continue with their treatment and be aware of new or worsening symptoms. Additional information can be found at the Substance Abuse and Mental Health Services Administration (SAMHSA) website.

Taking care of yourself, your friends, and your family can help you cope with stress. Helping others cope with their stress can also make your community stronger.

People who may respond more strongly to the stress of a crisis include:

- Older people and people with chronic diseases who are at higher risk for COVID-19
- Children and teens
- People who are helping with the response to COVID-19, like doctors and other health care providers, or first responders
- People who have mental health conditions including problems with substance use

Things you can do to support yourself

- Take breaks from watching, reading, or listening to news stories, including social media. Hearing about the pandemic repeatedly can be upsetting.
- Take care of your body. Take deep breaths, stretch, or meditate. Try to eat healthy, well-balanced meals, exercise regularly, get plenty of sleep, and avoid alcohol and drugs.
- Make time to unwind. Try to do some other activities you enjoy.
- Connect with others. Talk with people you trust about your concerns and how you are feeling.
- Call your healthcare provider if stress gets in the way of your daily activities for several days in a row.
Know when to get help

You may experience serious distress when you hear about an infectious disease outbreak, even if you are at little or no risk of getting sick. If you or someone you know shows signs of stress for several days or weeks, get help by accessing one of the resources at the end of this tip sheet. Contact the National Suicide Prevention Lifeline right away if you or someone you know threatens to hurt or kill him- or herself or someone else, or talks or writes about death, dying, or suicide.

Tips for Social (Physical) Distancing, Quarantine, and Isolation

Reaching out to people you trust is one of the best ways to reduce anxiety, depression, loneliness, and boredom during social (physical) distancing, quarantine, and isolation. You can:

- Use the telephone, email, text messaging, and social media to connect with friends, family, and others.
- Talk “face to face” with friends and loved ones using Skype or FaceTime.
- If approved by health authorities and your health care providers, arrange for your friends and loved ones to bring you newspapers, movies, and books.
- Relax your body often by doing things that work for you—take deep breaths, stretch, meditate or pray, or engage in activities you enjoy.
- Pace yourself between stressful activities, and do something fun after a hard task.
- Talk about your experiences and feelings to loved ones and friends, if you find it helpful.
- Maintain a sense of hope and positive

Reduce stress in yourself and others

Sharing the facts about COVID-19 and understanding the actual risk to yourself and people you care about can make an outbreak less stressful.

When you share accurate information about COVID-19 you can help make people feel less stressed and allow you to connect with them.

For parents

Children and teens react, in part, on what they see from the adults around them. When parents and caregivers deal with the COVID-19 calmly and confidently, they can provide the best support for their children. Parents can be more reassuring to others around them, especially children, if they are better prepared.
Not all children and teens respond to stress in the same way. Some common changes to watch for include:

- Excessive crying or irritation in younger children
- Returning to behaviors they have outgrown (for example, toileting accidents or bedwetting)
- Excessive worry or sadness
- Unhealthy eating or sleeping habits
- Irritability and “acting out” behaviors in teens
- Poor school performance or avoiding school
- Difficulty with attention and concentration
- Avoidance of activities enjoyed in the past
- Unexplained headaches or body pain
- Use of alcohol, tobacco, or other drugs

There are many things you can do to support your child:

- Take time to talk with your child or teen about the COVID-19 outbreak. Answer questions and share facts about COVID-19 in a way that your child or teen can understand.
- Reassure your child or teen that they are safe. Let them know it is ok if they feel upset. Share with them how you deal with your own stress so that they can learn how to cope from you.
- Limit your family’s exposure to news coverage of the event, including social media. Children may misinterpret what they hear and can be frightened about something they do not understand.
- Try to keep up with regular routines. If schools are closed, create a schedule for learning activities and relaxing or fun activities.
- Be a role model. Take breaks, get plenty of sleep, exercise, and eat well. Connect with your friends and family members.

For responders

Responding to COVID-19 can take an emotional toll on you. There are things you can do to reduce secondary traumatic stress (STS) reactions:

- Acknowledge that STS can impact anyone helping families after a traumatic event.
- Learn the symptoms including physical (fatigue, illness) and mental (fear, withdrawal, guilt).
- Allow time for you and your family to recover from responding to the pandemic.
- Create a menu of personal self-care activities that you enjoy, such as spending time with friends and family, exercising, or reading a book.
- Take a break from media coverage of COVID-19.
- Ask for help if you feel overwhelmed or concerned that COVID-19 is affecting your ability to care for your family and patients as you did before the outbreak.
- Learn more tips for taking care of yourself during emergency response.
For people who have been released from quarantine

Being separated from others if a healthcare provider thinks you may have been exposed to COVID-19 can be stressful, even if you do not get sick. Everyone feels differently after coming out of quarantine. Some feelings include:

- Mixed emotions, including relief after quarantine
- Fear and worry about your own health and the health of your loved ones
- Stress from the experience of monitoring yourself or being monitored by others for signs and symptoms of COVID-19
- Sadness, anger, or frustration because friends or loved ones have unfounded fears of contracting the disease from contact with you, even though you have been determined not to be contagious
- Guilt about not being able to perform normal work or parenting duties during quarantine
- Other emotional or mental health changes
- Children may also feel upset or have other strong emotions if they, or someone they know, has been released from quarantine. You can help your child cope.
